Full guide to
JavaScript

REGEX

A circular profile picture of a young man with dark hair, wearing a light-colored hoodie, sitting at a desk and looking at a computer screen. Below the image, the word "PROGRAMMER" is written in small capital letters.

Varun Sharma

RegEx ...?

A JavaScript Regular Expression (RegEx) is a tool for **matching patterns in strings**. It allows you to search, extract, and **manipulate text efficiently**.

Essentially, it is a sequence of characters defining a search pattern, commonly used for tasks like **validating input**, parsing data, or finding and **replacing text** in strings.

Let's discover some of its key features >>

A circular profile picture of a person with dark hair, wearing a light-colored shirt, sitting at a desk with a computer monitor. Below the image, the word "PROGRAMMER" is written in a small, sans-serif font.

Patterns

JS index.js

```
/* There's two ways in which we can define regular expression statements, known as patterns: */
```

```
//Double forward slashes
```

```
const regexExample1 = /pattern/;
```

```
//Using RegExp constructor
```

```
const regexExample2 = new RegExp("pattern");
```

Matches

JS index.js

```
/* The .test() method allows us to check if a
   string matches the defined pattern */

const string = "Follow CodeWithEmil";
const regex_1 = /follow/;
const regex_2 = /CodeWithEmil/;

console.log(regex_1.test(string));
// Returns "false": RegEx are case-sensitive

console.log(regex_2.test(string));
// Returns "true"
```

Classes

JS index.js

```
/* This technique, similar to arrays, allows us to  
match any element from a pattern to a text */
```

```
// Matching vowels  
const regex = /[aeiou]/;  
console.log(regex.test("hello")); //True (has vowels)  
console.log(regex.test("wrld")); //False (no vowels)
```

```
//Matching any digit  
const regex = /[0-9]/;  
console.log(regex.test("hello")); //False (no digits)  
console.log(regex.test("123")); //True (has digits)
```

Flags

JS index.js

```
/* Appended after the closing slash, flags modify
   how the regular expression behaves */

const text = "Hello world! New world I see...";
const replaceRegex = /world/g; //global flag used

console.log(
  text.replace(replaceRegex, "Test"));
); // Output: Hello Test! New Test I see...

/* The global flag modifies every instance of
   matching text instead of only the first one */
```

Varun Sharma

JS index.js

```
/* Use the "i" flag for case-insensitive matching */

const text = "I love Tacos, Tacos, Tacos";
const replaceRegex = /tacos/i; //i flag used

console.log(
    replaceRegex.test(text);
); // Output: true
```

PROGRAMMER

Quantifiers

JS index.js

/ Specifies how many times a character should appear in the input string */*

```
const regex = /a{2,4}/;

console.log(regex.test("a")); //False
console.log(regex.test("aa")); //True
console.log(regex.test("aaa")); //True
console.log(regex.test("aaaa")); //True
console.log(regex.test("aaaaa")); //False
```

/ This program checks whether the number of times "a" appears is between 2 and 4 */*

Swipe >

JS index.js

/ More types of quantifiers */*

// “” matches 0 or more of the preceding character*

console.log(/ho*/.test("hoo")); //True

console.log(/ho*/.test("h")); //True

// “+” matches 1 or more of the preceding character

console.log(/ho+/.test("hoo")); //True

console.log(/ho+/.test("h")); //False

// “?” matches 0 or 1 of the preceding character

console.log(/colou?r/.test("colour")); //True

console.log(/colou?r/.test("color")); //True

Varun Sharma

Anchors

JS index.js

```
/* Anchors are used to match a pattern with a
particular position within the input string */

// ^ searches for the beginning of a string
const regex = /^hello/;

console.log(regex.test("hello world")); //True
console.log(regex.test("world hello")); //False

// $ searches for the end of a string
const regex = /hello$/;

console.log(regex.test("hello world")); //False
console.log(regex.test("world hello")); //True
```

Swipe >>

Varun Sharma

Groups

JS index.js

```
/* By grouping things, you can match one of several options or apply rules (like repetition) to the whole group. */
```

```
const regex = /(hello|world)/;
```

```
console.log(regex.test("hello world")); //True
console.log(regex.test("My world is pretty")); //True
console.log(regex.test("Hola, hello, salut")); //True
console.log(regex.test("Follow for more!")); //False
```

```
/* This program verifies whether the string passed contains or not EITHER "hello" or "world" */
```
